E;269-272/Region: GTP-binding NKXD motif
E;2/Modified site: myristylated amino end (Gly) (in mature form) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A; Note: differences are due to different assignment of start codons C; Comment: The G proteins are a family of guantne nucleotide-binding p ains. The beta and gamma chains, required for GTPase activity, appear rase; it is specific for each type of G protein.

C; Comment: The Gi alpha chain is specific for G protein that is involv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GTP-binding regulatory protein Gi alpha-1 chain (adenylate cyclase-inhibiting) N;Alternate names: guanine nucleotide binding protein Gi alpha-1 chain; heterot C;Species: Bos primigenius taurus (cattle) C;Date: 31-Dec-1992 #sequence_revision 31-Dec-1992 #text_change 19-Jan-2001 C;Date: 31-Dec-1992 #sequence_revision 31-Dec-1992 #text_change 19-Jan-2001

Genet. 26:120-125(1994).

-i- FUNCTION: THE CONSTITUENT AMINO ACIDS OF CYCLOSPORINS ARE
-i- FUNCTIONED AS AMIONACYL-ADENYLATES WITH PEPTIDE BONDS FORMED
THROUGH THE PARTICIPATION OF AMINO ACID THIOLESTER INTERMEDIATES.
-I- COPACTOR: CONTAINS 11 COVALENTLY BOUND PHOSPHORANTETHEINES.
-i- COPACTOR: CONTAINS 11 COVALENTLY BOUND PHOSPHORANTETHEINES.
-i- PATHMAY: NON-RIBOSOMAL BIOGSYNTHESIS OF CYCLOSPORING.
-i- SIMILARITY: TO OTHER ENZYMES WHICH ACT VIA AN ATP-DEPENDENT
COVALENT BINDING OF AMP TO THEIR SUBSTRATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Weber G., Schoergendorfer K., Schneider-Scherzer E., Leitner E.; "The peptide synthetase catalyzing cyclosporine production in Tolypocladium niveum is encoded by a giant 45.8-kilobase open reading

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                  presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/jpublished_pct_sequences.

The present invention describes a method (M1) for producing an oil body associated with a recombinant multimeric protein complex (MPC). M1 comprises producing in a cell comprising oil bodies a first and second recombinant polypeptide (P1, P2), where P1 is capable of associating with P2 to form the MPC and associating the complex with an occlusion body (OB) through an OB-targeting-protein capable of associating with OB and P1. M1 is useful for producing an oil body associated with a recombinant MPC. The oil bodies are further formulated for use in the preparation of a food product such as milk or wheat based food product, personal care product which reduces the oxidative stress on the surface
                                                                                                                                                                                                Producing oil body associated with recombinant multimeric protein complex e.g. redox proteins and immunoglobulins comprises producing recombinant polypeptides capable of forming the complex in cells comprising oil bodies -
                                                                                                                                                                                                                                                                                                                                                       (SYGN )

sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Coryneform bacterium; amino acid synthesis; vitamin; saccharide; organic acid synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            C glutamicum protein fragment SEQ ID NO: 4130

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel BIN6 (ethylene insensitive 6) polynuclectide. The polynuclectide is useful in conferring an ethylene insensitive phenotype in plants, such as delayed ripening, flowering, delayed sensecence, browning, or altered sensitivity to pathogens, whice may improve the quality and longevity of many crops. The present sequent represents Y48B6A.11, a predicted protein from C. elegans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EIN6; ethylene insensitive 6; ethylene; plant; delayed ripening; flowering; delayed senescence; browning; pathogen sensitivity; longevity; fruitfly; CG9088.

presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21-APR-2000; 2000US-199047P

The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are

C. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the yresence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining E. acnes presence, for example, by conversion, but was obtained in electronic format directly from WIPO are fire with out was obtained in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a complex between two interacting proteins in CC adipocyte cells, given in the specification. The proteins are identified CC by selecting a bait protein from a known adipocyte marker and then CC performing a yeast 2-hybrid selection to isolate prey proteins encoded by CC members of an adipocyte cDNA library. The proteins are designated SID CC (RTM) (selected interacting domains) proteins. Also included are a CC polynucleotide encoding a polypeptide in the adipocyte cells, a CC recombinant host cell expressing at least one of the interacting CC polypeptides of the complex, selecting a modulating compound in adipocyte cells, a SID (RTM) polypeptide comprising any of the 738 amino acid CC sequences given in the specification (including its fragment or variant), a vector comprising the vector, a protein chip comprising the sID (RTM) polynucleotide, a recombinant host cell CC comprising the vector, a protein chip comprising the polypeptides, polynucleotide, a recombinant host cell CC useful for preventing or treating metabolic disorders such as obesity or diabetes. The polynucleotides are useful as probes or primers. The CC complex is particularly useful for identifying selected interacting CC interaction, thus exhibiting the therapeutic effect. The present CC sequence represents a SID (prey) protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC the melting point of the solution. An activated anti-freeze protein may CC be incorporated into plant, produce or fish in an amount sufficient to CC provide antifreeze protection or in a region of a target tissue to CC provide antifreeze protection or in a region of a target tissue to CC cryoinjury during cryosurgery. The proteins of the invention may also be CC used in hypothermic solutions or bathing media to reduce cold damage in CC date to provide cryogenic or hypothermic preservation of cells and CC tissues. The proteins may be used as de-icing formulations or used on CC surfaces to reduce existing ice buildup or abate the formation of ice buildup on surfaces such as a road, aircraft, household products, CC machinery and plant surfaces or as a food product to improve the quality CC of food by abating freezing of solutions, freezer burn, or degradation CC due to cold storage. The polynucleotides for the activated protein can be used to create transgenic or gene-modified plants, crops, fish, or animals having greater tolerance to cold climatisation. The Tm 12.86 antibody/antiserum which is also used as a screening device to screen CC DNA libraries in an expression swaterm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a cDNA polynucleotide comprising a nucleotide cosquence encoding a thermal hysteresis protein (THP) which is a Type III canti-freeze protein derived from the Tenebrionoidea Superfamily. Anti-cc freeze proteins lower the freezing point of a solution without affecting the melting point of the solution. An activated anti-freeze protein may compressed into plant, produce or fish in an amount sufficient to provide antifreeze protection or in a region of a target tissue to provide antifreeze protein to limit tumour cell or target tissue to cryoinjury during cryosurgery. The proteins of the invention may also be used in hypothermic solutions or bathing media to reduce cold damage in cryosurger to provide cryogenic or hypothermic preservation of cells and corder to provide cryogenic or hypothermic preservation of cells and crissues. The proteins may be used as de-icing formulations or used on crisces to reduce existing ice buildup or shate the formation of ice buildup on surfaces such as a road, aircraft, household products, can be used by abating freezing of solutions, freezer burn, or degradation cold use to cold storage. The polynucleotides for the activated protein can be used to create transgenic or gene-modified plants, crops, fish, or cold cold having greater tolerance to cold climatisation. The Tm 12.86 cantibody/antiserum which is also used as a screening device to screen cold.
                                                                                                                                                                                                                                                                                                                                                                               Query Match

cc sequence encoding a thermal hysteresis protein (THP) which is a Type III canti-freeze proteins lower the freezing proint of a solution without affecting the melting point of the solution. An activated anti-freeze protein may be incorporated into plant, produce or fish in an amount sufficient to provide antifreeze protein to limit tumour cell or target tissue to provide antifreeze protein to limit tumour cell or target tissue to cryoinjury during cryosurgery. The proteins of the invention may also be used in hypothermic solutions or bathing media to reduce cold damage in cryosurger to provide cryogenic or hypothermic preservation of cells and crisues. The proteins may be used as de-icing formulations or used on cold tissues. The proteins may be used as de-icing formulations or used on cold surfaces such as a road, aircraft, household products, cof food by abating freezing of solutions, freezer burn, or degradation cold used to create transgenic or gene-modified plants, crops, fish, or cold surfaces in an expression system, including cross-species cDNA collibraries in an expression system, including cross-species cDNA collibraries in an expression system, including cross-species cDNA collibraries to identify homologous sequences in other species. The coll was created to facalitate purification cof the Tm 13.17 protein and to try to enhance the anti-freeze activity of the recombinant protein and to try to enhance the anti-freeze activity of the recombinant protein and to try to enhance the anti-freeze activity of the recombinant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          X S X X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           X T T

-I- FUNCTION: MULTIFUNCTIONAL TRANSCRIPTION FACTOR THAT EXHIBITS POSITIVE AND NEGATIVE CONTROL ON A LARGE NUMBER OF CELLULAR AN VIRAL GENES BY BINDING TO SITES OVERLAPPING THE TRANSCRIPTION START SITE. MAY PLAY AN IMPORTANT ROLE IN DEVELOPMENT AND DIFFERENTIATION. THE FUNCTION OF YY1 AS AN ACTIVATOR OR A REPRESSOR IS SPECIFIED BY THE PRESENCE OF OTHER PROTEINS. FOR EXAMPLE IT ACTS AS A REPRESSOR IN ABSENCE OF ADENOVIRUS EIA PROTEIN BUT AS AN ACTIVATOR IN ITS PRESENCE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Park K., Atchison M.;
